CLOCK IN · SOLANA MOBILE HACKATHON · BY EIGENAGE

Heart Alpha

Trade without burning out.

Read your trading the way an athlete reads their training: a Solana Seeker app that reads your body, the market and your own wallet into one call each morning.

THE PROBLEM

Traders decide with a body they never check.

A bad night

A short night, a late drink, illness coming on: each changes how you take risk.

A market that doesn't care

Volatility and fear arrive on their own schedule, not yours.

Nothing joins them

No app on a trader's phone puts the morning's state next to the day's trades and their P&L.

HEALTH FIRST

Trading wears traders down. Protect the trader, and better trading follows.

Late nights, markets that never close, stress that rises with volatility: on a London trading floor, traders' cortisol rose with market volatility. Coates & Herbert, PNAS 2008

Permission to rest: "Trade smaller" or "Stand aside" on strained mornings.

Recovery counts: rest days and weekly load, as in training.

Sleep first: on-chain past midnight while strained is flagged.

Calm on demand: breathing sized to the day, heart rate coming down live.

THE IDEA

Athletes already solved this. Trading is a sport.

Endurance athletes take a morning HRV reading and set the day's training by it. Heart Alpha reads every trading day as a session.

Load

The share of your wallet you moved. This week against the four before it.

Intensity

Easy, moderate or hard: twice your usual size, on-chain past midnight, a big SOL move.

Recovery

The next morning's HRV, CV and resting heart rate, against your own normal.

EACH MORNING

One call for the day, with a size.

Trade as planned, Trade smaller, Stand aside: from the body's state against the market's.

HRV, CV, resting heart rate, each a 7-day average against your own normal. Tap any for its chart.

What to do with your body today: breathing, sized to the state you are in.

HOW IT WORKS

Three inputs, read on the phone.

Body

A chest strap over Bluetooth: one minute on waking, HRV computed beat by beat on the phone. No wearable company's cloud in between.

Market

Fear priced in options (DVOL), a SOL volatility index built on the phone from Deribit's SOL options, and Fear & Greed.

Wallet

Mobile Wallet Adapter, read-only. Signed history from Solana, several wallets combined, P&L matched first in, first out.

Health data, wallet history and results never leave the device.

ARCHITECTURE AND DATA FLOW

Three inputs in, everything computed on the phone.

Chest strap
Bluetooth LE, Heart Rate service: beat-to-beat intervals

Solana
Address from Mobile Wallet Adapter; signed history from RPC

Market
Binance, Deribit options, Fear & Greed: public data

→

ON THE PHONE

Kotlin BLE module → HRV (rMSSD), bad beats filtered

Personal baselines → daily assessment and size

Swaps per night → load, intensity, FIFO P&L

Statistics → correlations, pre-registered tests

→

One call for the day, with a size

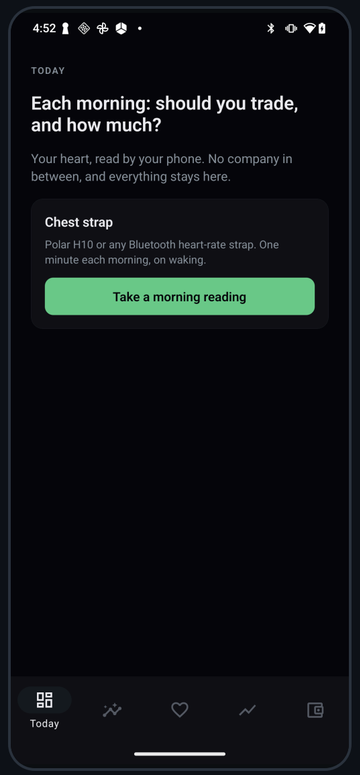

Charts with P&L under every one

Breathing, with live HRV

Nothing is uploaded. The only network calls fetch public market data and the wallet's public chain history. No account, no server.

THE APP, SCREEN BY SCREEN

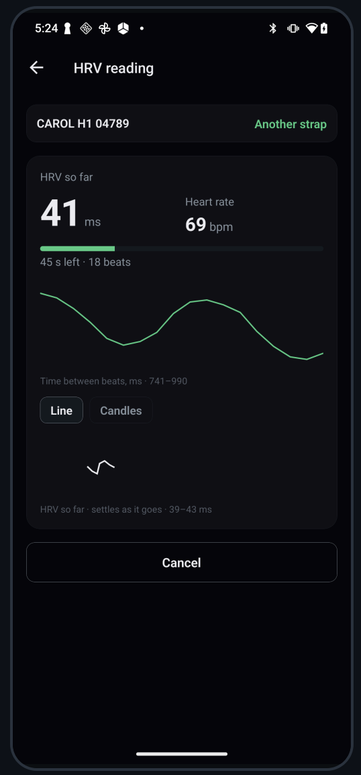

From first open to the day's call.

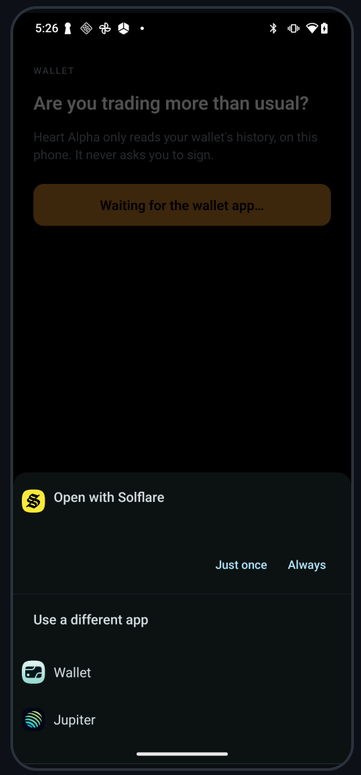

1 · First run

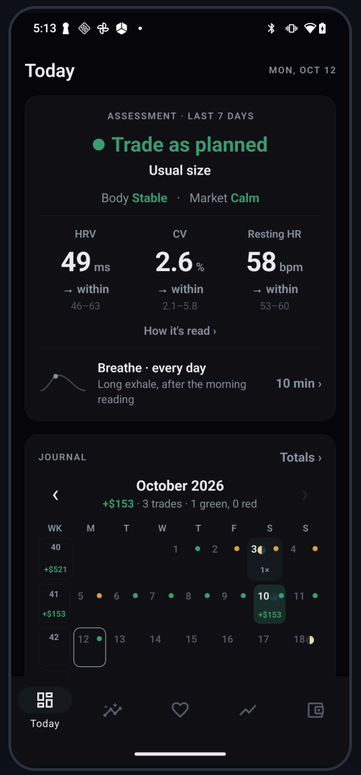

2 · Strap paired

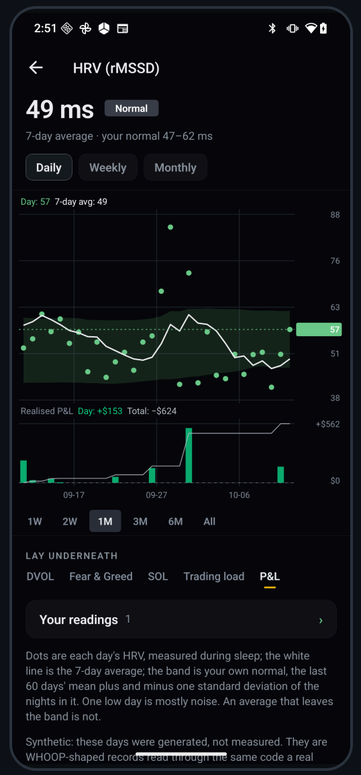

3 · Live reading

4 · Wallet connect

5 · Daily call

6 · Charts + P&L

Failure states handled: Bluetooth off · permission denied · strap not found or lost · no skin contact · poor reading, measure again. Screens 5–6 use sample data.

THE MONEY

Your P&L, under every chart.

Every morning's assessment as a chart, with that day's trading load and realised P&L under it.

The same pane lays under HRV, the market and every price chart: daily bars, with the running total as a hairline.

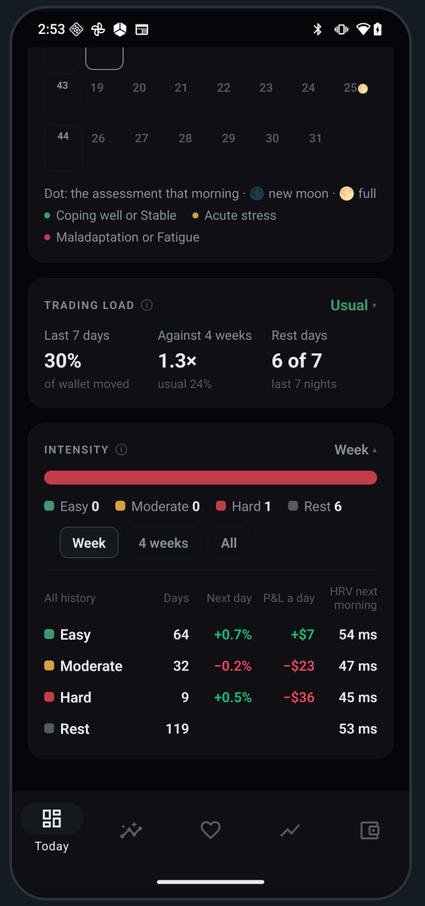

YOUR OWN HISTORY

What your days did to you, and to your money.

Each kind of day: its next-day result, its P&L a day, and the HRV the morning after.

Correlations rank what moves your P&L, beyond a band of what chance alone gives.

Shown on the app's synthetic trader.

WHY IT CAN BE TRUSTED

Honest numbers, from the first morning.

Your normal, not a population's

A 7-day average against the up to 60 days before it, ±1 standard deviation.

Starts on day one, sharpens

The market's call from the first morning, the body's from the second, firm at two weeks.

Few false alarms

In simulation, 5% of calm mornings flagged; a real stress spell caught on 89% of its mornings.

Questions written first

Pre-registered tests, a block bootstrap, the market's day held fixed.

THE EVIDENCE, AND NO FALSE CONFIDENCE

Built on research, held to your own data.

Why the signal

HRV-guided training beat a fixed plan in a controlled trial. Kiviniemi et al., Eur J Appl Physiol 2007

Higher HRV goes with stronger prefrontal self-control and executive function. Thayer et al., Ann Behav Med 2009

Traders' bodies move with risk: physiology tracks market events; morning hormones predicted the day's profit. Lo & Repin, J Cogn Neurosci 2002 · Coates & Herbert, PNAS 2008

Swing read with the baseline flagged overreaching before the mean moved. Plews et al., Eur J Appl Physiol 2012

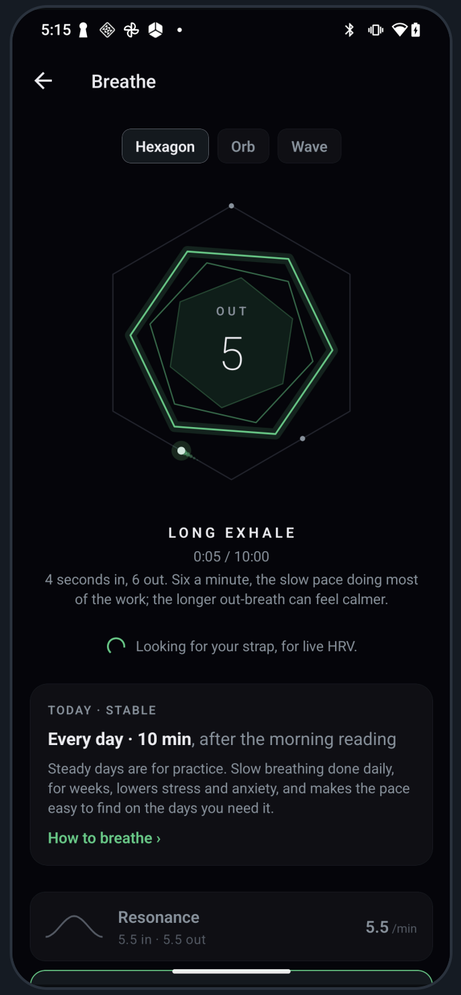

How it avoids false confidence

Your normal only: no population scores, no fixed thresholds.

Calibrated alarms: a swing counts only past what 19 normal weeks in 20 reach; in simulation 5% of calm mornings flagged, a stress spell caught 89% of the time.

Chance shown: every correlation against a band of what chance gives; tests written before the data, block bootstrap, the market's day held fixed.

Says when it is early: "early read" until two weeks of mornings.

WHAT TO DO ABOUT IT

Breathing, prescribed by the assessment.

Body	Breathe
Stable, coping	10 min a day, after the reading
Acute stress	5 min before you trade, and after a loss
Fatigue	15 min before bed

Slow, about six breaths a minute, with live HRV from the strap while you breathe.

SOLANA MOBILE

Built for the Seeker.

Mobile Wallet Adapter

Read-only connect; several wallets read as one.

A native Android app

Bluetooth strap, one-hand screens, charts you pinch.

On the device

No server ever sees your body or your wallet.

A working APK

Running on a Seeker today, ready for the dApp Store.

SOLANA MOBILE AND SKR

Read-only by design. SKR next.

Why wallet history is enough today

The wallet is the training log. Every swap is already signed on Solana; Mobile Wallet Adapter gives the address, and the app never asks to sign or move funds.

Zero friction. No account, no server, no token needed to start.

SKR already counts. Swaps in and out of SKR enter your load and P&L like any token.

SKR roadmap (planned)

Morning-streak commitments: stake SKR on your own reading habit. The phone attests that you took the reading, never what it said.

Encrypted backup in SKR: your mornings, sealed with a key from your wallet; no one else can read them.

dApp Store listing, curated by SKR stakers.

WHERE IT STANDS

Implemented, and planned.

Working in the APK today

- ✓ Bluetooth strap reading, HRV computed on the phone
- ✓ Daily assessment and position size, from day one
- ✓ Mobile Wallet Adapter, read-only, several wallets
- ✓ Transaction import, FIFO realised P&L
- ✓ P&L under every chart; assessment history
- ✓ Correlations and pre-registered tests
- ✓ Breathing with live HRV · running on a Seeker

Planned

- ○ Wallet-encrypted backup of your mornings
- ○ SKR streak commitments
- ○ Nudges at the hours you trade worst
- ○ dApp Store listing

The demo's history screens use sample data: a real user's history fills in from the second morning, and is firm after two weeks.

WHY IT STICKS

A one-minute ritual that is worth more every week.

Every morning

One minute with the strap, one call for the day.

Sharper with time

Your normal firms up and your own questions get answered.

About your money

What each kind of morning made or lost you, in dollars.

Trade the day your body can carry.
